

**Senior Leadership Briefing**  
**Post-Tropical Cyclone Irma**  
**Sunday, September 17, 2017 (5:00 a.m. EDT)**  
**Updates in Blue**

**Current Situation:**

**Florida Flooding:** Portions of several rivers in Florida will continue to experience major flooding into next week. Record flooding is not anticipated. Isolated showers and thunderstorms will be possible across the state through Tuesday. Widespread heavy rainfall is not expected. Heat indices will reach into the mid-90s to near 100 degrees each afternoon.

**Hurricane Jose:** At 5:00 a.m. EDT, Hurricane Jose was located 420 miles south-southeast of Cape Hatteras North Carolina with maximum sustained winds of 80 mph. Jose is moving toward the north near 8 mph, and this general motion with a slight increase in forward speed is expected through early Tuesday. Jose is forecast to remain a Hurricane through early Tuesday. While Jose is currently forecast to remain offshore of the U.S. coast from Virginia northward to New England, the large cyclone could cause some direct impacts to these areas and any deviation to the left of the NHC forecast track would increase the likelihood and magnitude of those impacts.

**Tropical Storm Maria:** At 5:00 a.m. EDT, Tropical Storm Maria was located 460 miles east-southeast of the Lesser Antilles with maximum sustained winds of 65 mph. Maria is moving toward the west-northwest near 15 mph and this motion with a further reduction in forward speed is expected over the next couple of days. On the forecast track, the center of Maria will be near the Leeward Islands Monday night. Maria will likely become a Hurricane later today. Maria could affect the U.S. Virgin Islands and Puerto Rico by mid-week as a dangerous major hurricane, and hurricane watches will likely be issued today. (NOAA Update, September 17, 2017, 5:00 a.m. EDT)
